

**The Buzzards Bay Stormwater Collaborative
Healthy Communities Grant Water Quality Data Report
September 2018**

<http://stormwater.buzzardsbay.org/>
<http://buzzardsbayaction.org/index.html>

Prepared by the
Buzzards Bay National Estuary Program
2870 Cranberry Highway
East Wareham, MA 02538

Town of Acushnet

Project Overview

The Buzzards Bay Stormwater Collaborative Project was a pilot program of the Buzzards Bay Action Committee (BBAC) to map stormwater collection networks and monitor stormwater discharges that are contributing to shellfish bed closures and other pollution-caused impairments in the Buzzards Bay watershed. Funding for the program was provided by a U.S. EPA Healthy Communities grant program to the BBAC. The elimination of illicit discharges to stormwater networks and the treatment of stormwater discharges conveying non-point sources of pollution will help reduce these impairments, but these actions can only be taken if problem discharges can be identified and prioritized. The Buzzards Bay National Estuary Program (BBNEP) provided planning and technical support for this effort.

The Buzzards Bay Stormwater Collaborative is a regional inter-municipal program that through cost-effectively sharing of resources and expertise has begun the vital first steps of monitoring discharges and mapping stormwater networks. One of the deliverables of this project includes this detailed report which provides critical information to the participating municipalities to make informed decisions about improving water quality of locally impaired waters. More detailed GIS and raw water quality data are available from the BBNEP upon request. The comprehensive summary information in this report includes: water quality data for individual discharge points; prioritization of stormwater discharges based on water quality analysis; identification of potential illicit connections; and specific recommendations for each discharge.

Water quality data was collected from the summer of 2016 through the fall of 2017 by the BBAC Stormwater Collaborative. This final report for each individual town includes all collected stormwater quality data, GIS mapping of stormwater infrastructure, identification of possible illicit connections, and recommendations for municipal stormwater priorities.

Stormwater Mapping Initiative

An important first step to solving local stormwater issues is an understanding of the character and connectivity of the stormwater infrastructure. The water quality at an outfall is an indicator of the health of the catchment in which that outfall services. A catchment can be a very limited area or several hundred acres. Defining that catchment requires the knowledge of the connectivity of the catchbasins, manholes, and pipes that cumulate to the outfall discharge. An issue with water quality isn't necessarily what is happening at that outfall pipe or roadcut but what could be happening hundreds or thousands of feet away.

Recognizing the importance of understanding the relationship of stormwater infrastructure to water quality of Buzzards Bay, the Buzzards Bay National Estuary Program (BBNEP) began mapping a fundamental inventory of catchbasins and outfalls over 20 years ago. The Stormwater Atlas last updated in 2012 allowed for an early start of the stormwater monitoring program. Information from this atlas provided the basis for a strategic monitoring plan, including potential monitoring site locations. Without this information, the start of the monitoring program would have been significantly delayed. At the outset of the project preselected sampling locations were found, evaluated, and documented for the monitoring program by BBNEP staff. This resulted in 250 well established monitoring locations and sampling strategies.

The Atlas also provided a beginning point for a more detailed GIS mapping program. Updating, improving, and expanding the Atlas was a major accomplishment of this project. A systematic approach to GIS data development was used to map stormwater structures and their connectivity. The mapping component of this project began with verification and mapping grade GPS location of existing Atlas features. Many new above ground structures were discovered and added to the Atlas and all structures were more accurately located. This was limited to about 15% for the Town of Acushnet and covered areas where stormwater was sampled. The other four participating towns were covered by GPS mapping for the much of the entire town because sampling occurred throughout.

The next steps in the mapping process, was to scan storm drain plans and geo-reference the plans in GIS. All plans made available to the project from all five towns were scanned. Plans needed to determine stormwater infrastructure connectivity were geo-referenced. The entire towns of Dartmouth and Fairhaven were covered by geo-referenced plans and were provided to the BBNEP. The Town of Mattapoisett had limited plan coverage, but what was available was geo-referenced. The Town of Acushnet was geo-referenced for the project area and the Town of Wareham is still being processed.

Finally stormwater pipes are being added to the GIS database by using the GPS located above ground structures and the below ground connectivity shown in the plans. This has been completed for the towns of Fairhaven and Dartmouth and has been started for the other three participating towns. In limited areas attributes are added to the GIS database from information shown on the plans. Developing the GIS database for all five participating municipalities, as well as other municipalities in the Buzzards Bay watershed, is an ongoing process that will continue depending on available resources. The level of completeness varies with each of the towns and was mostly a function of the amount of infrastructure, quantity and quality of plans, and area covered by the project.

Unfortunately, plans and GPS locations do not always agree. In those cases a field verification of existing conditions is required to resolve questions. This type of field work is labor intensive and involves the assistance of the local department of public works to provide institutional knowledge, open manhole covers, clear catchbasins, and use metal detectors to find structures. A limited amount of this work has been done in each town and will be an ongoing process as mapping and water quality issues are examined.

Summary of Sampling Methods

This project investigated 250 discharge points which included both pipe outfalls and roadcuts. A total of 547 monitoring visits resulted in 657 water quality samples. Water samples were tested for nine different parameters to determine if there are potential illicit connections as well as the presence of water quality issues. Also, 724 'no-flow' / 'no-sample' observations were made and documented for many outfalls. These observations document that some discharges have no dry weather flow. An indication of no dry weather flow is an important characteristic of a discharge and is required as part of the MS4 permitting process. Note that an observation of 'no-flow' does not preclude the possibility of an illicit connection but it might indicate that it is less likely. See table 1 for itemization by town.

Table 1 - Summary of Discharges and Samples

Municipality	Total Number of Discharges	Number of Project Discharges	Number of Stormwater Samples	No-Flow No-Sample Observations
Acushnet	119	15	77	72
Dartmouth	575	47	70	111
Fairhaven	354	65	266	173
Mattapoisett	557	26	106	87
Wareham	930	97	138	281
Total	2535	250	657	724

The water quality data collection consist of three components – field testing, indoor analysis of nitrates and surfactants, and certified laboratory analysis for bacteria. The basic methods and equipment for each component is described below in tables 2, 3, and 4. See QAPP for additional details.

Table 2 - Field Testing

Parameter	Equipment	Operating Range	Resolution	Accuracy
Ammonia	Hach Test Strips	0-6ppm	0.25ppm	+/- one half of a color block
Conductivity	HachPocket Pro, Multi 2	0 to 200 µS/cm or 2.00-19.9 mS/cm (auto-range)	0.01mS/0.1µS/1.0uS (range dependent)	±1.0%
Salinity	HachPocket Pro, Multi 2	0 to 10 ppt	0.01 ppt	±1%
Temperature	HachPocket Pro, Multi 2	0 to 50°C (32 to 122°F)	0.1°C	±0.5°C
pH	HachPocket Pro, Multi 2	0.0-14.0	0.01	0.02

Table 3 – Indoor (in-office) Analysis

Parameter	Equipment	Operating Range	Resolution	Accuracy	Holding Time
Surfactants (detergents as MBAS)	CHEMetrics K-9400 ¹	0-3 ppm	+ 1 color standard increment	+ 30% error	48 hours
Nitrates	LaMotte Nitrate-Nitrogen test kit (3615-01)	0.00 to 1.00 ppm	0.1ppm	0.1ppm	24 hours

Table 4 - Certified Laboratory Analysis

Parameter	Sample Container	Holding Time	Field Processing/	Method	Units
Fecal Coliform	100 ml sterilize polyethylene	6 hours	Collect, label, store on blue ice	Membrane Filtration, wastewater, SM9222D, 21 th Edition 2005	cfu/100ml
Enterococci	100 ml sterilize polyethylene	6 hours	Collect, label, store on blue ice	EPA Office of Water, Method 1600, Membrane Filter Test EPA 821-R-97-004.	cfu/100ml

Relation of Project to MS4 Permit

As noted above, the primary area of focus for the Collaborative was to monitor discharges and map connections of stormwater outfalls that directly discharge into shellfish beds and other impaired coastal waters. Many of these discharges must also be monitored, and their stormwater collection systems mapped, as part of the US Environmental Protection Agency (EPA) Small Municipal Separate Storm Sewer Systems (MS4) permit. For the most part the Collaborative's discharge monitoring program adheres to the EPA MS4 permit monitoring requirements. Therefore, the activities of the Collaborative will partially help the town meet the MS4 permit monitoring requirements, outreach and education efforts, and water quality testing training. The Stormwater Collaborative only monitored and mapped a fraction of each participating town's MS4 discharges and discharge networks through this program. The program directed efforts towards discharges associated with impaired waters that impact shellfish beds. For example, inland discharges affecting fresh-waterbodies and streams (non-shellfish waters) were not monitored under this program , but are required to be considered for the MS4 permit.

Under the MS4 permit program, each municipality must assess discharges to any impaired waters or wetlands from their "Urbanized Area", not just discharges to coastal waters. The new small MS4 permits in Massachusetts became effective on July 1, 2018. This 2016 permit is a continuation your 2003 MS4 permit and may include an expansion of the 2003 Urbanized Area.

Each municipality's first obligations to obtain a new MS4 permit is prepare and submit a Notice of Intent (NOI) by September 29, 2018. The NOI provides an update of the 2003 permit and an outline of future activities within the scope of the 2016 permit requirements. By July 1, 2019, each permittee must develop a Storm Water Management Plan (SWMP) describing in more detail how activities outlined in your NOI will be accomplished. To summarize, the key differences between the Buzzards Bay Stormwater Collaborative Program efforts and your MS4 permit requirements are:

- the activities of the Collaborative were limited to monitoring discharges and mapping discharge networks directly affecting impaired coastal waters. These discharges may or may not be within UAs as defined by EPA;
- EPA's MS4 permit requires that municipalities obtain a permit and evaluate all stormwater discharges serving their Urbanized Area Stormwater collection networks. Discharges to impaired waters outside the Urbanized Area are not included in your 2016 MS4 permit.

Another factor to consider with the MS4 permitting process is the concentration of bacteria when monitoring. Much of the output from this report has been based on bacteria levels chosen for appropriate analysis in the context of this study. These levels are different than Massachusetts Department of Environmental Protection regulatory standards as described in 314 CMR the Massachusetts Surface Water Quality Standards. See table 5 below for some examples of regulatory thresholds for bacteria levels.

Table 5 – Massachusetts Surface Water Quality Standards Summary

Receiving Water Class	Parameter	Standard
Unfiltered WS - A	Fecal coliform [CFU]	< = 20 in six month period
Filtered WS -A & B	Enterococci [CFU]	< = 126 geometric mean
Filtered WS -A & B	E. coli [CFU]	< = 33 in six month period
SA (Shellfish)	Fecal coliform [CFU]	< = 14 geometric mean
SA/SB (Beaches)	Enterococci [CFU]	< = 35 geometric mean
SB (w/ depuration)	Fecal coliform [CFU]	< = 88 geometric mean

Summary Maps

Included in this report are maps of sampling areas throughout the participating municipalities. These maps are intended to be a quick overview of the areas sampled. Discharges must be addressed on an individual basis and the best method for assessing water quality issues is the examination of the data sheet for the discharge. A data sheet for each discharge is also included in this report. Discharges on the map have an outer circle symbol for the Stormwater Classification and an inner dot for the Illicit Discharge Classification. Also shown is the facility ID number for the discharge which can be used to reference the corresponding data sheet. A comprehensive, interactive version of this map is available on line. The process for determining these classifications is based on raw data from the water quality samples and do reflect the best interpretation from the BBNEP in regards to defining thresholds for bacteria and water quality data. If different thresholds were chosen, the maps would be remarkably different. The maps do not stand alone; informed planning decisions need to include analysis of site specific monitoring data. Below is a description of the methods used for the symbols on the maps.

Stormwater Classification:

Criteria: freshwater samples only; samples from flows only; wet weather samples only; and based on maximum observation of bacteria (Fecal coliform [CFU] or Enterococci [CFU]).

Table 6 - Map Legend for Stormwater Classification

Symbol		Bacteria
	High Concern	> 10,000
	Medium Concern	50 – 10,000
	Low Concern	< 50
	Not Determined	No Data

Illicit Discharge Classification:

Criteria: freshwater (non-tidal) samples only; samples from flows only; wet or dry weather samples; and based on maximum observation of bacteria (Fecal coliform [CFU] or Enterococci [CFU]) with number of water quality parameters with maximum observation above threshold. These thresholds are > 0.50 ppm for Ammonia (NH_3), > 0.25 ppm for Surfactants, and > = 0.44 ppm for Nitrate (NO_3^-).

Table 7 – Map Legend for Illicit Discharge Classification

Symbol		Bacteria		Water Quality Parameter
●	Elevated Potential	> 10,000	and / or	3 above threshold
●	Some Potential	50 – 10,000	and / or	2 above threshold
●	Low Potential	< 50	and	1 or less above threshold
●	Not Determined			No Data

Discharge Data Sheets

Included in this report are individual data sheets for each discharge studied. These sheets include basic information about the outfall, results of water quality analysis, and some interpretation of the results. A sample data sheet is provided with an explanation of each field. Additional raw data about field conditions, unusual observations, rainfall details, and various notes are all maintained in the water quality database. The information shown on these data sheets provide valuable insight to local stormwater issues and where resources might be allocated to address these issues. See example below.

1. Name of the discharge and associated catchment
2. Town and location of discharge
3. Map showing area near discharge along with facility id numbers for nearby infrastructure

4. MassDEP 2014 Integrated List of Waters (305(b)/303(d)); Name of receiving water body along with Class, Category, and Qualifier of water body
5. Indication if discharge is in a MS4 urbanized area and if the catchment area has sewer service
6. MS4 Ranking for discharge based on permit language; possible ranks include:
 - Not Determined
 - Problem Outfall
 - High Priority Outfall
 - Medium Priority Outfall
 - Low Priority Outfall
 - Excluded Outfall
7. BBNEP summary status; possible status suggestions include:
 - Evaluation Not Complete
 - Requires Additional Monitoring
 - No Apparent Issues – Allocate Resources Elsewhere
 - Some Concern Warranted – Continue Monitoring
 - Some Concern Warranted – Consider Corrective Action
 - Requires Immediate Attention
8. BBNEP specific analysis and recommendation
9. Photograph of discharge point (if available)
10. Rating of discharge based on water quality data (objective determination)
 - Only freshwater (<6 ppt salinity) and flowing waters used for scoring
 - Maximum of observed sample values used for scoring
 - If parameter above threshold, 1 point each for ammonia, nitrate, and surfactants - These thresholds are > 0.50 ppm for Ammonia (NH₃), > 0.25 ppm for Surfactants, and > = 0.44 ppm for Nitrate (NO₃).
 - Bacteria could be either Fecal coliform or Enterococci
 - Bacteria scored between 0 for > 50 CFU, 1 for 50 – 10,000 CFU, and 2 for >10,000 CFU
 - Total scores range between 0 and 5
 - Separate scores for Dry Weather and Wet Weather (>0.02 inches in 4 hours previous to sample)
11. Number of dry weather visits where no flow was observed and thus no samples taken
12. Water quality data:
 - **FacilityID** – facility identifier for location of sample; may vary and be different than discharge ID
 - **SampleDate** - date the water sample was taken
 - **SampleID** – sample identification number used to track internally and at laboratory
 - **Sample Type** - type of sample collected: pipe, stream, surface, or sump
 - **Water Classification** – Fresh Water if <6 ppt salinity else classified as Brackish or Sea Water
 - **Last Rain** – number of hours since last rain and time of sample
 - **12 hr. Rain** – number of inches of rain in previous 12 hours
 - **pH** – sample pH
 - **Temp** – sample temperature in degrees centigrade
 - **Salinity** – sample salinity in parts per thousand
 - **Ammo** – sample ammonia concentration in parts per million

The Buzzards Bay Stormwater Collaborative
Healthy Communities Grant Water Quality Data Report
September 2018

<http://stormwater.buzzardsbay.org/>
<http://buzzardsbayaction.org/index.html>

Prepared by the
Buzzards Bay National Estuary Program
2870 Cranberry Highway
East Wareham, MA 02538

Town of Acushnet

Project Overview

The Buzzards Bay Stormwater Collaborative Project was a pilot program of the Buzzards Bay Action Committee (BBAC) to map stormwater collection networks and monitor stormwater discharges that are contributing to shellfish bed closures and other pollution-caused impairments in the Buzzards Bay watershed. Funding for the program was provided by a U.S. EPA Healthy Communities grant program to the BBAC. The elimination of illicit discharges to stormwater networks and the treatment of stormwater discharges conveying non-point sources of pollution will help reduce these impairments, but these actions can only be taken if problem discharges can be identified and prioritized. The Buzzards Bay National Estuary Program (BBNEP) provided planning and technical support for this effort.

The Buzzards Bay Stormwater Collaborative is a regional inter-municipal program that through cost-effectively sharing of resources and expertise has begun the vital first steps of monitoring discharges and mapping stormwater networks. One of the deliverables of this project includes this detailed report which provides critical information to the participating municipalities to make informed decisions about improving water quality of locally impaired waters. More detailed GIS and raw water quality data are available from the BBNEP upon request. The comprehensive summary information in this report includes: water quality data for individual discharge points; prioritization of stormwater discharges based on water quality analysis; identification of potential illicit connections; and specific recommendations for each discharge.

Water quality data was collected from the summer of 2016 through the fall of 2017 by the BBAC Stormwater Collaborative. This final report for each individual town includes all collected stormwater quality data, GIS mapping of stormwater infrastructure, identification of possible illicit connections, and recommendations for municipal stormwater priorities.

Stormwater Mapping Initiative

An important first step to solving local stormwater issues is an understanding of the character and connectivity of the stormwater infrastructure. The water quality at an outfall is an indicator of the health of the catchment in which that outfall services. A catchment can be a very limited area or several hundred acres. Defining that catchment requires the knowledge of the connectivity of the catchbasins, manholes, and pipes that cumulate to the outfall discharge. An issue with water quality isn't necessarily what is happening at that outfall pipe or roadcut but what could be happening hundreds or thousands of feet away.

Recognizing the importance of understanding the relationship of stormwater infrastructure to water quality of Buzzards Bay, the Buzzards Bay National Estuary Program (BBNEP) began mapping a fundamental inventory of catchbasins and outfalls over 20 years ago. The Stormwater Atlas last updated in 2012 allowed for an early start of the stormwater monitoring program. Information from this atlas provided the basis for a strategic monitoring plan, including potential monitoring site locations. Without this information, the start of the monitoring program would have been significantly delayed. At the outset of the project preselected sampling locations were found, evaluated, and documented for the monitoring program by BBNEP staff. This resulted in 250 well established monitoring locations and sampling strategies.

The Atlas also provided a beginning point for a more detailed GIS mapping program. Updating, improving, and expanding the Atlas was a major accomplishment of this project. A systematic approach to GIS data development was used to map stormwater structures and their connectivity. The mapping component of this project began with verification and mapping grade GPS location of existing Atlas features. Many new above ground structures were discovered and added to the Atlas and all structures were more accurately located. This was limited to about 15% for the Town of Acushnet and covered areas where stormwater was sampled. The other four participating towns were covered by GPS mapping for the much of the entire town because sampling occurred throughout.

The next steps in the mapping process, was to scan storm drain plans and geo-reference the plans in GIS. All plans made available to the project from all five towns were scanned. Plans needed to determine stormwater infrastructure connectivity were geo-referenced. The entire towns of Dartmouth and Fairhaven were covered by geo-referenced plans and were provided to the BBNEP. The Town of Mattapoisett had limited plan coverage, but what was available was geo-referenced. The Town of Acushnet was geo-referenced for the project area and the Town of Wareham is still being processed.

Finally stormwater pipes are being added to the GIS database by using the GPS located above ground structures and the below ground connectivity shown in the plans. This has been completed for the towns of Fairhaven and Dartmouth and has been started for the other three participating towns. In limited areas attributes are added to the GIS database from information shown on the plans. Developing the GIS database for all five participating municipalities, as well as other municipalities in the Buzzards Bay watershed, is an ongoing process that will continue depending on available resources. The level of completeness varies with each of the towns and was mostly a function of the amount of infrastructure, quantity and quality of plans, and area covered by the project.

Unfortunately, plans and GPS locations do not always agree. In those cases a field verification of existing conditions is required to resolve questions. This type of field work is labor intensive and involves the assistance of the local department of public works to provide institutional knowledge, open manhole covers, clear catchbasins, and use metal detectors to find structures. A limited amount of this work has been done in each town and will be an ongoing process as mapping and water quality issues are examined.

Summary of Sampling Methods

This project investigated 250 discharge points which included both pipe outfalls and roadcuts. A total of 547 monitoring visits resulted in 657 water quality samples. Water samples were tested for nine different parameters to determine if there are potential illicit connections as well as the presence of water quality issues. Also, 724 'no-flow' / 'no-sample' observations were made and documented for many outfalls. These observations document that some discharges have no dry weather flow. An indication of no dry weather flow is an important characteristic of a discharge and is required as part of the MS4 permitting process. Note that an observation of 'no-flow' does not preclude the possibility of an illicit connection but it might indicate that it is less likely. See table 1 for itemization by town.

Table 1 - Summary of Discharges and Samples

Municipality	Total Number of Discharges	Number of Project Discharges	Number of Stormwater Samples	No-Flow No-Sample Observations
Acushnet	119	15	77	72
Dartmouth	575	47	70	111
Fairhaven	354	65	266	173
Mattapoisett	557	26	106	87
Wareham	930	97	138	281
Total	2535	250	657	724

The water quality data collection consist of three components – field testing, indoor analysis of nitrates and surfactants, and certified laboratory analysis for bacteria. The basic methods and equipment for each component is described below in tables 2, 3, and 4. See QAPP for additional details.

Table 2 - Field Testing

Parameter	Equipment	Operating Range	Resolution	Accuracy
Ammonia	Hach Test Strips	0-6ppm	0.25ppm	+/- one half of a color block
Conductivity	HachPocket Pro, Multi 2	0 to 200 μ S/cm or 2.00-19.9 mS/cm (auto-range)	0.01mS/0.1 μ S/1.0uS (range dependent)	\pm 1.0%
Salinity	HachPocket Pro, Multi 2	0 to 10 ppt	0.01 ppt	\pm 1%
Temperature	HachPocket Pro, Multi 2	0 to 50°C (32 to 122°F)	0.1°C	\pm 0.5°C
pH	HachPocket Pro, Multi 2	0.0-14.0	0.01	0.02

Table 3 – Indoor (in-office) Analysis

Parameter	Equipment	Operating Range	Resolution	Accuracy	Holding Time
Surfactants (detergents as MBAS)	CHEMetrics K-9400 ¹	0-3 ppm	+ 1 color standard increment	+ 30% error	48 hours
Nitrates	LaMotte Nitrate-Nitrogen test kit (3615-01)	0.00 to 1.00 ppm	0.1ppm	0.1ppm	24 hours

Table 4 - Certified Laboratory Analysis

Parameter	Sample Container	Holding Time	Field Processing/	Method	Units
Fecal Coliform	100 ml sterilize polyethylene	6 hours	Collect, label, store on blue ice	Membrane Filtration, wastewater, SM9222D, 21 th Edition 2005	cfu/100ml
Enterococci	100 ml sterilize polyethylene	6 hours	Collect, label, store on blue ice	EPA Office of Water, Method 1600, Membrane Filter Test EPA 821-R-97-004.	cfu/100ml

Relation of Project to MS4 Permit

As noted above, the primary area of focus for the Collaborative was to monitor discharges and map connections of stormwater outfalls that directly discharge into shellfish beds and other impaired coastal waters. Many of these discharges must also be monitored, and their stormwater collection systems mapped, as part of the US Environmental Protection Agency (EPA) Small Municipal Separate Storm Sewer Systems (MS4) permit. For the most part the Collaborative's discharge monitoring program adheres to the EPA MS4 permit monitoring requirements. Therefore, the activities of the Collaborative will partially help the town meet the MS4 permit monitoring requirements, outreach and education efforts, and water quality testing training. The Stormwater Collaborative only monitored and mapped a fraction of each participating town's MS4 discharges and discharge networks through this program. The program directed efforts towards discharges associated with impaired waters that impact shellfish beds. For example, inland discharges affecting fresh-waterbodies and streams (non-shellfish waters) were not monitored under this program , but are required to be considered for the MS4 permit.

Under the MS4 permit program, each municipality must assess discharges to any impaired waters or wetlands from their "Urbanized Area", not just discharges to coastal waters. The new small MS4 permits in Massachusetts became effective on July 1, 2018. This 2016 permit is a continuation your 2003 MS4 permit and may include an expansion of the 2003 Urbanized Area.

Each municipality's first obligations to obtain a new MS4 permit is prepare and submit a Notice of Intent (NOI) by September 29, 2018. The NOI provides an update of the 2003 permit and an outline of future activities within the scope of the 2016 permit requirements. By July 1, 2019, each permittee must develop a Storm Water Management Plan (SWMP) describing in more detail how activities outlined in your NOI will be accomplished. To summarize, the key differences between the Buzzards Bay Stormwater Collaborative Program efforts and your MS4 permit requirements are:

- the activities of the Collaborative were limited to monitoring discharges and mapping discharge networks directly affecting impaired coastal waters. These discharges may or may not be within UAs as defined by EPA;
- EPA's MS4 permit requires that municipalities obtain a permit and evaluate all stormwater discharges serving their Urbanized Area Stormwater collection networks. Discharges to impaired waters outside the Urbanized Area are not included in your 2016 MS4 permit.

Another factor to consider with the MS4 permitting process is the concentration of bacteria when monitoring. Much of the output from this report has been based on bacteria levels chosen for appropriate analysis in the context of this study. These levels are different than Massachusetts Department of Environmental Protection regulatory standards as described in 314 CMR the Massachusetts Surface Water Quality Standards. See table 5 below for some examples of regulatory thresholds for bacteria levels.

Table 5 – Massachusetts Surface Water Quality Standards Summary

Receiving Water Class	Parameter	Standard
Unfiltered WS - A	Fecal coliform [CFU]	< = 20 in six month period
Filtered WS -A & B	Enterococci [CFU]	< = 126 geometric mean
Filtered WS -A & B	E. coli [CFU]	< = 33 in six month period
SA (Shellfish)	Fecal coliform [CFU]	< = 14 geometric mean
SA/SB (Beaches)	Enterococci [CFU]	< = 35 geometric mean
SB (w/ depuration)	Fecal coliform [CFU]	< = 88 geometric mean

Summary Maps

Included in this report are maps of sampling areas throughout the participating municipalities. These maps are intended to be a quick overview of the areas sampled. Discharges must be addressed on an individual basis and the best method for assessing water quality issues is the examination of the data sheet for the discharge. A data sheet for each discharge is also included in this report. Discharges on the map have an outer circle symbol for the Stormwater Classification and an inner dot for the Illicit Discharge Classification. Also shown is the facility ID number for the discharge which can be used to reference the corresponding data sheet. A comprehensive, interactive version of this map is available on line. The process for determining these classifications is based on raw data from the water quality samples and do reflect the best interpretation from the BBNEP in regards to defining thresholds for bacteria and water quality data. If different thresholds were chosen, the maps would be remarkably different. The maps do not stand alone; informed planning decisions need to include analysis of site specific monitoring data. Below is a description of the methods used for the symbols on the maps.

Stormwater Classification:

Criteria: freshwater samples only; samples from flows only; wet weather samples only; and based on maximum observation of bacteria (Fecal coliform [CFU] or Enterococci [CFU]).

Table 6 - Map Legend for Stormwater Classification

Symbol		Bacteria
	High Concern	> 10,000
	Medium Concern	50 - 10,000
	Low Concern	< 50
	Not Determined	No Data

Illicit Discharge Classification:

Criteria: freshwater (non-tidal) samples only; samples from flows only; wet or dry weather samples; and based on maximum observation of bacteria (Fecal coliform [CFU] or Enterococci [CFU]) with number of water quality parameters with maximum observation above threshold. These thresholds are > 0.50 ppm for Ammonia (NH_3), > 0.25 ppm for Surfactants, and > = 0.44 ppm for Nitrate (NO_3^-).

Table 7 – Map Legend for Illicit Discharge Classification

Symbol		Bacteria		Water Quality Parameter
●	Elevated Potential	> 10,000	and / or	3 above threshold
●	Some Potential	50 – 10,000	and / or	2 above threshold
●	Low Potential	< 50	and	1 or less above threshold
●	Not Determined			No Data

Discharge Data Sheets

Included in this report are individual data sheets for each discharge studied. These sheets include basic information about the outfall, results of water quality analysis, and some interpretation of the results. A sample data sheet is provided with an explanation of each field. Additional raw data about field conditions, unusual observations, rainfall details, and various notes are all maintained in the water quality database. The information shown on these data sheets provide valuable insight to local stormwater issues and where resources might be allocated to address these issues. See example below.

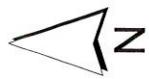

1. Name of the discharge and associated catchment
2. Town and location of discharge
3. Map showing area near discharge along with facility id numbers for nearby infrastructure

4. MassDEP 2014 Integrated List of Waters (305(b)/303(d)); Name of receiving water body along with Class, Category, and Qualifier of water body
5. Indication if discharge is in a MS4 urbanized area and if the catchment area has sewer service
6. MS4 Ranking for discharge based on permit language; possible ranks include:
 - Not Determined
 - Problem Outfall
 - High Priority Outfall
 - Medium Priority Outfall
 - Low Priority Outfall
 - Excluded Outfall
7. BBNEP summary status; possible status suggestions include:
 - Evaluation Not Complete
 - Requires Additional Monitoring
 - No Apparent Issues – Allocate Resources Elsewhere
 - Some Concern Warranted – Continue Monitoring
 - Some Concern Warranted – Consider Corrective Action
 - Requires Immediate Attention
8. BBNEP specific analysis and recommendation
9. Photograph of discharge point (if available)
10. Rating of discharge based on water quality data (objective determination)
 - Only freshwater (<6 ppt salinity) and flowing waters used for scoring
 - Maximum of observed sample values used for scoring
 - If parameter above threshold, 1 point each for ammonia, nitrate, and surfactants - These thresholds are > 0.50 ppm for Ammonia (NH₃), > 0.25 ppm for Surfactants, and > = 0.44 ppm for Nitrate (NO₃).
 - Bacteria could be either Fecal coliform or Enterococci
 - Bacteria scored between 0 for > 50 CFU, 1 for 50 – 10,000 CFU, and 2 for >10,000 CFU
 - Total scores range between 0 and 5
 - Separate scores for Dry Weather and Wet Weather (>0.02 inches in 4 hours previous to sample)
11. Number of dry weather visits where no flow was observed and thus no samples taken
12. Water quality data:
 - **FacilityID** – facility identifier for location of sample; may vary and be different than discharge ID
 - **SampleDate** - date the water sample was taken
 - **SampleID** – sample identification number used to track internally and at laboratory
 - **Sample Type** - type of sample collected: pipe, stream, surface, or sump
 - **Water Classification** – Fresh Water if <6 ppt salinity else classified as Brackish or Sea Water
 - **Last Rain** – number of hours since last rain and time of sample
 - **12 hr. Rain** – number of inches of rain in previous 12 hours
 - **pH** – sample pH
 - **Temp** – sample temperature in degrees centigrade
 - **Salinity** – sample salinity in parts per thousand
 - **Ammo** – sample ammonia concentration in parts per million

- **Nitrate** – sample nitrate concentration in parts per million
- **Surfact** – sample surfactants concentration in parts per million (detergent indicator)
- **Enterococcus** – laboratory results for enterococcus bacteria colony forming units per 100 ml
- **Fecal Coliform** - laboratory results for fecal coliform bacteria colony forming units per 100 ml

Re: National Pollutant Discharge Elimination System Permit ID #: MAR041085, Town of Acushnet

Dear Merilee Kelly:

The 2016 NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts (MS4 General Permit) is a jointly issued EPA-MassDEP permit. Your Notice of Intent (NOI) for coverage under this MS4 General Permit has been reviewed by EPA and appears to be complete. You are hereby granted authorization by EPA and MassDEP to discharge stormwater from your MS4 in accordance with the applicable terms and conditions of the MS4 General Permit, including all relevant and applicable Appendices. This authorization to discharge expires at midnight on **June 30, 2022**.

For those permittees that certified Endangered Species Act eligibility under Criterion C in their NOI, this authorization letter also serves as EPA's concurrence with your determination that your discharges will have no effect on the listed species present in your action area, based on the information provided in your NOI.

As a reminder, your first annual report is due by **September 30, 2019** for the reporting period from May 1, 2018 through June 30, 2019.

Information about the permit and available resources can be found on our website:
<https://www.epa.gov/npdes-permits/massachusetts-small-ms4-general-permit>. Should you have

any questions regarding this permit please contact Newton Tedder at tedder.newton@epa.gov or (617) 918-1038.

Sincerely,

Thelma Murphy, Chief
Stormwater and Construction Permits Section
